

TREE ASSESSMENT

Tree ID: TR00113	Site address of tree: 57 Ryley Street, Wangaratta	Date of inspection: 11/11/2016	
Recommended action: Remove tree			
Reasons for recommended action: Whilst it is acknowledged that the tree is in good health, its form has become unmanageable and the potential for further failures is high. With long, overextended limbs & stems, the ability to successfully reduce the crown is limited. There have already been failures of large branches and there are signs of mechanical stress in others. Given the location of the tree in the landscape close to many high value targets and its limited ability for reduction pruning, it should be removed.			
Tree Number: 1	Common name: Lemon-scented Gum	Botanical name: <i>Corymbia citriodora</i>	
Target: 2. Pedestrians 8-72/hr	Failure Size: 3. 101-250mm	Failure Potential 2. 1/10	
Risk Assessment	1/5,000	High Risk	
Age Mature	Height (m) 24	Spread (m) 20	DBH (mm) 1230
Roots condition: Roots barely visible although the trunk flare is evident. There is very little damage to surrounding infrastructure given the wide nature strip		Trunk condition: Fair. There are 2 main stems. Stem 1 is upright, straight and the dominant stem. Stem 2 is on the northern side and extends out from approximately 2m up the trunk There is no sign of decay in timber	
Limbs condition: Poor, the limbs are generally overextended and there is evidence of previous failures. There are few laterals to which the tree canopy could be pruned back		Foliage condition: Good, the canopy is full and there is no sign of pest or disease	
Amenity value: High, The tree is a large specimen visible from many vantage points. It is likely to be quite old and may have local heritage significance.			
Name: Cameron Ryder		Date report written up: 20/11/2016
